---

## Product Overview

Product: Google Pay (UPI-based digital payments app)

Daily Use Case: Sending/receiving money, mobile recharge, bill payments, checking transaction history.

- Target Users: Students, professionals, shopkeepers, and anyone using UPI for payments.
- 

## UX Problems Identified

1. Cluttered Home Screen
  - o Too many shortcuts, offers, and promotional banners.
  - o Users get confused when looking for “Pay to Contact” or “Scan QR.”
2. Confusing Transaction History
  - o Long list of transactions, not grouped clearly.
  - o Difficult to quickly find a specific payment (no simple filter for “only recharges” or “only bills”).
3. Low Visibility of Help & Support
  - o Users face failed transactions but support option is hidden under layers.
  - o Causes frustration and wasted time.

## Suggested Improvements

1. SimplifyHomeScreen
    - o Show only key actions upfront: “Pay Contact,” “Scan QR,” “Pay Bills.”
    - o Move offers & rewards to a separate tab.
  2. Improved Transaction History
    - o Add filters (Contacts, Bills, Recharges, Merchants).
    - o Provide a search bar to quickly find a past payment.
  3. Visible Help & Support
    - o Add a small “Help?” button near each transaction entry.
    - o Direct link to raise issue for failed transactions.
- 

## Mockup Ideas (Before vs After)

### Before(Current):

Home: Cluttered with offers + too many icons.

History: Flat list with no categories.

Support: Hidden deep inside settings.

### After (Proposed):

Home: Clean layout with 3 main buttons (Pay Contact, Scan QR, Pay Bills).

History: Filter & search bar on top.

Support: Help icon next to each transaction.

(👉 You can design simple mockups using Canva/Figma with side-by-side “Before” and “After” screens.)

## Conclusion

Better Usability: Faster payments with less confusion.

Improved Navigation: Easy access to past transactions.

Reduced Frustration: Support button directly available.

Impact: Builds user trust, increases app adoption, and reduces churn.
